Sone + Shiki

Syntax-highlighted code in PDF documents

sone/shiki · github-dark / github-light

1. TypeScript

Use createSoneHighlighter() to pre-load themes and languages. Each call to Code() returns a Sone ColumnNode ready to embed in any layout.

```typescript
import { createSoneHighlighter } from "sone/shiki"

const highlight = await createSoneHighlighter({
  themes: ["github-dark"],
  langs: ["typescript", "javascript"],
})

const block = highlight.Code(`const greet = (name: string) => \`Hello, ${name}!\``, {
  lang: "typescript",
  fontSize: 13,
  fontFamily: ["monospace"],
})
```

2. Python

The same highlighter supports any language bundled with Shiki. Here is a Python example using github-light theme.

```python
from dataclasses import dataclass
from typing import Optional

@dataclass
class User:
    id: int
    name: str
    email: Optional[str] = None

def fetch_user(user_id: int) -> User:
    data = api.get(f"/users/{user_id}")
    return User(**data)
```

3. Shell

Build and run the visual tests from the project root:

```shell
# Install dependencies
npm install

# Build the library
npm run build

# Run all tests
npm test

# Generate visual regression outputs
```

```
npx tsx test/run-visual.ts
```
